NEOMED DATA LEAK EXPOSES MEDICAL RECORDS OF MILLIONS

Cloud healthcare provider NeoMed confirmed that a misconfigured database exposed private surgical histories and treatment records affecting nearly 30% of citizens.

The incident did not involve malware, broken encryption, or stolen passwords. Once attackers crossed the system perimeter, the data was immediately visible.

> "We believed our infrastructure was secure,"
> NeoMed's CEO said.
>
> "Access was restricted and monitored."

Investigators later revealed that sensitive healthcare data was stored in plain, readable form within internal databases. Any system role with read access intended or otherwise. could directly view patient records.

> "This wasn't a vault," said an independent security researcher.
>
> "It was glass. Strong walls, full visibility."

Because the access patterns matched normal internal activity, the breach went undetected for weeks. Public outrage intensified after architectural details emerged.

> "Why did the service provider even have the ability to read the data they were supposed to protect?"
>
> ~ Excerpt from a parliamentary hearing

A regulatory review concluded that the failure was not perimeter security, but system design.

> "The moment a system reveals more data than is strictly necessary, it has already failed its security model."

The post-incident report stated that NeoMed's platform was designed around who could access data, not what anyone should be allowed to know. Once access was obtained, there were no further safeguards limiting knowledge or exposure.
